

Abstract

The invention concerns a floor construction comprising a plurality of surface portions (12) which each comprise at least one respective material with possibly different properties, in particular properties in regard to human perception when standing on the surface portions (12), wherein the different surface portions (12) are of such an arrangement and configuration that when moving on the floor construction (10) a continuously changing, unforeseeable sequence of different surface portions (12) has to be unavoidably stepped upon.
